Name of the HoD: Dr. Anandaraj

Name of the Program Project Coordinator: Ms Priyanka Niranjan

Name of the School Project Coordinators: Dr. Sampath A K, Dr. Geetha A

#### **Abstract**

An energy-efficient automated public lighting system is proposed using ESP-NOW — a low-power, low-latency, peer-to-peer wireless protocol supported by ESP32 microcontrollers. The system uses distributed sensor nodes (Ambient light) mounted on street poles to detect time and ambient luminance. Nodes communicate locally using ESP-NOW to coordinate switching and dimming of lights, while a gateway node aggregates status and relays logs to a cloud server over Wi-Fi for monitoring and analytics. The design reduces energy consumption by dimming lights during low-activity periods and turning them to full brightness on demand, improves response time compared to cloud-dependent systems, and keeps costs low by using off-the-shelf ESP32 hardware.

### **Objectives**

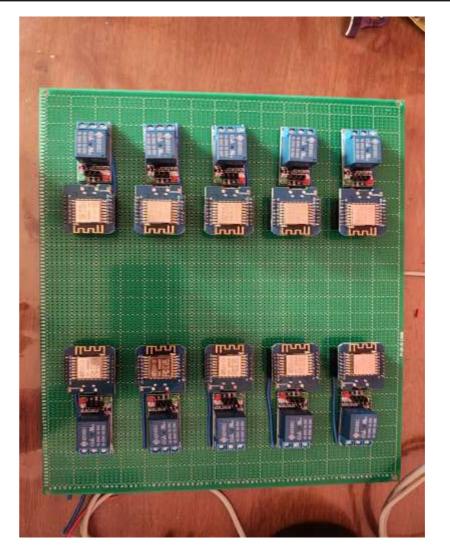

- •Design a low-cost, low-latency public lighting control system using ESP32 devices and ESP-NOW.
- •Implement local, autonomous decision-making at each pole (ambient light based).
- •Achieve at least 50% energy savings relative to always-on lighting through dimming and on-demand brightening.
- •Enable a gateway for remote monitoring, logging, and OTA updates.
- •Ensure reliability and safety (fail-safe: lights default to safe brightness on communication failure).
- •Demonstrate scalability across multiple poles with robust inter-node coordination.

## **Challenges**

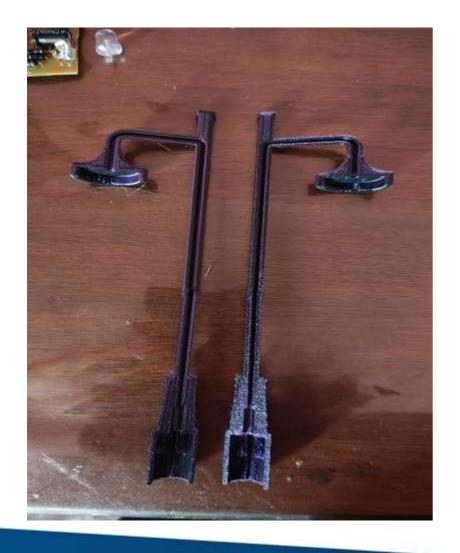

- •Accurate synchronization of RTC with the microcontroller
- •Relay circuit integration with high-voltage streetlight wiring
- •Handling power fluctuations during operation
- •Ensuring weatherproofing and protection from dust/moisture
- •Maintaining long-term reliability in outdoor conditions
- •Multiple trials needed for correct time calibration and scheduling

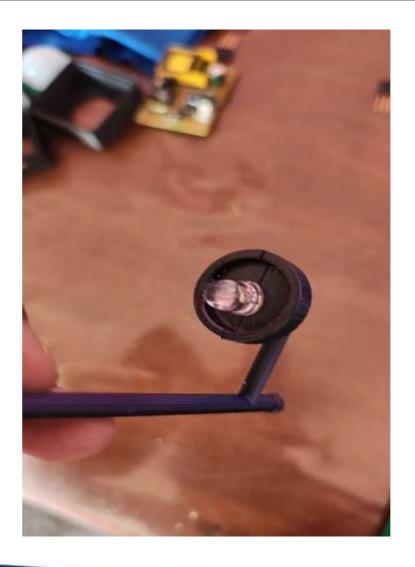

## **Project Progression**

## **Architecture Diagram**

### **Hardware & Software Requirements**

#### **Software Requirements**

IDE: Arduino IDE

• Libraries: ESP8266WiFi, ESP-NOW.

• Protocol: ESP-NOW (for peer-to-peer communication)

#### **Hardware Requirements**

<u>Item</u> <u>Specification</u>

Microcontrollers ESP8266 (D1mini) ×6 units

Sensors Ambient Light Sensor × 1

Actuators 5V Single-Channel Relay Modules ×6

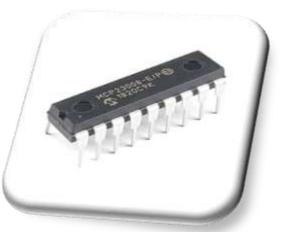

Lights LEDs (for simulation)

Power 5V Power Supply

## **Components**

5V Active Low Relay

I2C [Inter-Integrated circuit]

Ambient Light Sensor

D1mini NodeMcu

## **Programming Video**

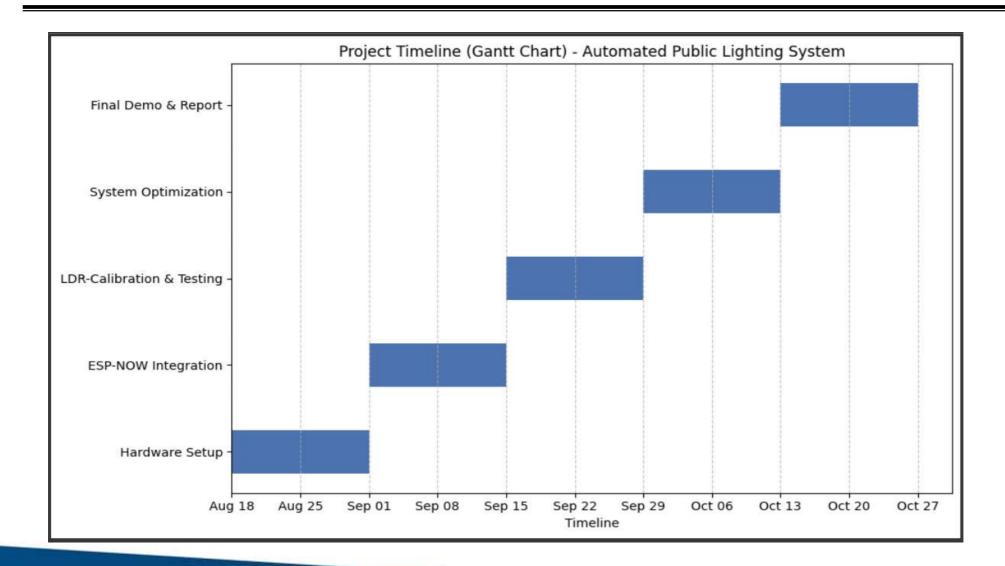

Microcontroller Programming
